

# Where Do You Need *Your* ADABAS Data Today?

## NatQuery – ADABAS Extraction Made Easy

MVS/VSE

Windows/UNIX

With today's demand for data, an organization needs to be able to respond quickly to requests for information. Not only is data needed quickly, it needs to be made available in a wide variety of formats and integrated to a wide variety of targets.

While there are tools available that address data extraction from ADABAS, there is only one that actually embraces and leverages the power that is inherent in an existing Natural / ADABAS environment, and that product is **NatQuery**.

Do you have End-Users that need the simple ability to directly load ADABAS data into Access or Excel without IT intervention? Do you need to build a Data Warehouse or Data Mart with ADABAS data, with the additional need to integrate extracted data and Predict Metadata with the Extraction Transformation and Loading (ETL) tool of your choice? Do you need a tool that will publish ADABAS data onto the Web, or into XML / XSL, or, will simply provide data that is ready to load into databases such as Oracle, SQL Server, or DB2?

**NatQuery** solves all of these problems with an approach that is completely native to your Natural / ADABAS server environment. NatQuery delivers a solution that requires *No* mainframe installation, *No* middleware (beyond basic FTP), and *No* extensive training to use effectively.

**NatQuery:** The Natural Evolution for Data Extraction from ADABAS.
